Oric joins up with Edenspring

ORIC Products International is to become part of Edenspring Investments, the property and travel investment group.

The takeover by Edenspring gives Oric the additional finance needed to fund expansion.

Said Oric's chairman John Tullis, "Because we are increasing our trade so rapidly and going into a number of new products in 1984 we have had to widen our capital base to finance the developments — we would not have been able to fund that ourselves."

John would not be drawn on the details of the new products: "We have new computers and peripherals and we also have products which are not in the computer field, particularly in the area of electronic optics."

"I intend to widen the company's product base and it is hoped that within two years computers and peripherals will

Continued on page 5

Aquarius dropped but reappears

MATTEL is to drop the Aquarius computer.

But it will not disappear. Instead, it will be taken over by its present manufacturer, Radofin. At the same time, the price of the machine — still to be called the Aquarius — will drop to £59.95, possibly to be discounted by retailers down to £49.95.

Confirming the changes, Radofin's managing director, Alan Leboff, said: "The deal we

have done with Mattel means that they will bring the price down to this level and then, at some point, we will take over supplying dealers directly, rather than as at present where we supply Mattel, who in turn supply the retailers."

"We hope the price drop will have a dramatic effect on sales," he added.

Mattel's wish to ease itself out of its Aquarius commitment

How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

All submissions should be typed and a double space should be left between each line. Please leave wide margins.

Programs should, whenever possible, be computer printed.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your own program returned you must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Editorial

Back in the days when the ZX81 was no more than a gleam in Uncle Clive's eye, authors were busily engaged in signing away the rights to their books to film companies. Most authors receive only a modest income from their endeavours, so the prospect of obtaining additional cash is always welcome.

Unfortunately, up until comparatively recently, authors were not just signing away the film rights to their books — they were also signing away the video game rights. Thus, when the Tolkien Estate gave Fantasy Films the rights to *The Lord of the Rings*, it also signed away the video game rights. Fantasy Films, in turn, has signed a deal with Parker Brothers, giving them the rights to produce an arcade game based on the Tolkien classic.

Consequently, Melbourne House, which produced an excellent adventure game around *The Hobbit*, is prevented from doing a follow-up. The Tolkien Estate no longer has the rights to *The Lord of the Rings* and Parker Brothers are not interested in giving Melbourne House any subsidiary rights.

However, it would be possible for Melbourne House to make a *Hobbit 2*, based on characters and situations from *The Hobbit* rather than *The Lord of the Rings*, if the Tolkien Estate was agreeable. But, despite the success of *The Hobbit*, the Tolkien Estate has decided against a *Hobbit 2*.

Unless the Tolkien Estate changes its mind, *The Hobbit* saga has come to an end.

Next Thursday

Just like Icarus, if you fly too close to the sun your feathers will come unstuck. Stick them back on to avoid falling to the ground, and gain points. Icarus, next week's star game for the unexpanded Vic20 by H Rivera.

Aquarius

Continued from page 1

ments would appear to be a result of the heavy financial losses incurred by the US parent company. Mattel will continue to support its toy business and Intellivision console.

In an increasingly competitive market, Mattel, being neither a computer designer nor manufacturer, would appear to have been squeezed out.

Radofin, on the other hand, being both the designer and far eastern manufacturer of the Aquarius (and the Intellivision), seems better placed to be competitive — as indicated by the swingeing price cut which it has now imposed, effective within the next few weeks.

By Christmas, it is hoped that Radofin will be the sole supplier of Aquarius computers. Other prices are also to come down — the games cartridges (now licenced from Mattel) will come down to £12.95, home business packs will fall by about £30 to £28.95 and the data recorder comes down £10 to £39.95.

At the same time, Radofin is developing a range of cassette software for the Aquarius and a light-pen will be launched in late November.

Mattel's urgent wish to withdraw from the very competitive home computer market has been prompted by losses for the whole group of \$156.1m for the quarter to July 1. For the same period, Mattel's computer and video game division lost \$166.7m.

Oric

Continued from page 1

form no more than 50 percent of our business."

Under the deal with Edenspring, Oric will — through a shares issue — gain an initial 18 per cent shareholding in the combined group. If, in the two-year period from June 30 1983, Oric turns in a pre-tax profit of more than £2m then, through a further shares issue, Oric will increase its holding in Edenspring to 44.2 per cent.

Shares in Edenspring — suspended at 9p on October 4 — value the Oric takeover at just over £8m.

Additional share issues by Edenspring will satisfy Oric's present outstanding loans of

Microcare supports Flex system

MICROCARE's decision, announced last week, to support the Flex disc operating system on the Dragon is a direct challenge to Dragon which has chosen to support the OS9 disc system (see *Popular Computing Weekly*, October 6).

"We have negotiated with Technical Systems Consultants for the rights to the Flex operating system for the Dragon," said Microcare's Eric Brook.

Any disc operating system — once tailored to a particular machine — allows standard software packages written for the system to be run.

Says Eric: "Flex is much better than OS9, because it has been around much longer and there is more software written for it."

"OS9 has about five years' catching up to do on Flex — OS9 is more complicated than Flex and therefore more difficult to use and Flex is also cheaper."

To begin with, Microcare will offer the following range of software. Languages: TSC Compiled Basic, TSC Compiled Pascal, Dynasoft Tiny Pascal, TSC Basic Pre-compiler, Compuserse Cobol,

M&J Forth, Windrush PL9. Utilities: Super Sleuth processor disassembler, Windrush Mace, TSC De-bug, OS9 simulator, cross-assembler. Applications: TSC text processor, Dynastar II word processor, Dynaform, Dynaspell, UDRI Inventory, UDRI Database Management System, UDRI Accounts, UDRI Ledger, RMS record management system, TSC Sort/ Merge.

Flex will cost £65 or £90 with an editor/assembler. It will be configured for the Premier Delta disc system, but a version to run on Dragon's own disc system will follow.

Neither Flex nor OS9 will run on a 32K Dragon, but Microcare is offering to upgrade a Dragon 32 to 64K. Dragon has apparently issued seven different circuit boards for the Dragon 32, and the price of the upgrade depends on the board.

Flex from Microcare will be ready at the beginning of November — the same time as Dragon's 64K machine, but some weeks before Dragon launches its OS9. Details from Microcare, 1 Oakwood Road, Rode Heath, Stoke-on-Trent.

No escape from Maggie

NOVEMBER 5 would seem an appropriate enough date to launch an adventure game which "gently knocks the political establishment".

Roger Taylor, author of *Denis Through the Drinking Glass*, explains that his text-only adventure program puts you in the role of Denis, trying to escape the Iron Lady.

The program understands about 300 words, and each of the 80 locations in the adventure is introduced with a small verse which Roger freely admits is pretty appalling.

The program is for the 48K Spectrum and will cost £5.50, available from Applications, 8 St Paul's Road, Peterborough.

Official US launch

ACORN officially launched its BBC computer in the US last

Stalked and torpedoed by Interface

HUNTER KILLER is the first two-player interactive game to take advantage of the networking facility now offered by the Spectrum.

Edinburgh-based Protek began development of the game well before the ZX Interface 1 was announced — intending to sell its own simple networking device for two 48K Spectrums. Now the game has been adapted to work with the Sinclair unit.

Set in the North Sea during the Second World War, the game is an elaborate simulation of submarine warfare.

Each player, using a 48K Spectrum, must try to stalk and torpedo the other. An accompanying 12-page booklet explains control of the submarines — steering, diving, diesel and electric propulsion, navigation and using the periscope, torpedoes, radar, asdic warning and depth sounder.

Protek's Gordon Hewitt explained: "For the first time, using the networking, you are not tracking a tame target. Instead it is very much alive and each player must play a game of cat-and-mouse."

During the play the positions, speeds and headings of both submarines are constantly exchanged between the players, using the networking on Interface 1.

Hunter Killer, written by Rod Hopkins, will be available before the end of October. The price of £7.95 includes both the one and two-player versions of the game.

week. As in the UK, the machine will initially be promoted for use in education.

The BBC B will sell for \$995 and Acorn is already claiming advance orders for 12,000 units worth \$21m.

Acorn's US subsidiary has so far signed agreements with 14 major American software publishers to develop material for the computer.

John Tullis

John Tullis and Barry Muncaster will both join the board of Edenspring on the completion of the acquisition.

Edenspring Investments came into being earlier this year, rescued from Pennine Commercial Holdings which ran into financial difficulties.

AGF

PROGRAMMABLE JOYSTICK INTERFACE

for Spectrum or ZX81

MICRODRIVE
COMPATIBLE

ONLY
32.95
+£100pp

ABOUT OUR INTERFACE

The AGF Programmable Joystick Interface is a unique design offering the use of any Atari-compatible joystick with absolutely all software, whether it is cassette or ROM cartridge, with the Sinclair Spectrum or ZX81.

The hardware programmable interface requires no additional software and accurately replicates the keys of the computer in a manner which is responsive to absolutely ALL key reading methods, both BASIC and Machine Code.

The interface does not interfere with key operation and can therefore be used simultaneously with the keyboard.

There is no need to remove the interface once fitted as the rear extension connector will accommodate further expansion, i.e. printers or RAM packs etc. This important feature avoids excessive wear in the expansion port.

The key replication principle pioneered by AGF means that your own programs can use eight directional joystick movement by utilising simple key reading BASIC.

Two joystick sockets are provided which share the same keys, for use with the majority of two player games. Several interfaces may be used on the same computer for multiple joystick applications.

The interface is programmed by a two digit code, which is looked up on a programming chart supplied, for each direction and firing button. The two numbers are then selected on a pair of leads which are clipped onto appropriately numbered strips on the interface.

Once configured this can be marked on a Quick Reference Programming Card for storing with the game. As the programming is not power dependent the interface retains the last configuration made and can be immediately used when next switched on.

KEY FEATURES

- Programmable design gives TOTAL software support.
- Accepts Atari, Competition Pro, Wico, Starfighter, Quick Shot, La Stick etc.
- Rear extension connector for all other add-ons.
- Free demo program and instructions.

PACKAGE CONTENTS SUPPLIED

- Programmable Interface Module as illustrated, complete with clip-on programming leads.
- Self adhesive programming chart detailing how to define which key is simulated by UP, DOWN, LEFT, RIGHT, and FIRE. This can be fixed on to the case of your computer or if preferred the protective backing can be left on. The chart is made of a very durable reverse printed plastic and is extremely easy to read.
- One pack of ten Quick Reference Programming Cards for at-a-glance setting to your games requirements. The card allows you to mark the configuration in an easy to read fashion with space to record the software title and company name.
- Video Graffiti demonstration program which is written totally in BASIC to illustrate how all eight directions and fire can be read. This is also a useful high resolution drawing program.
- 12 months guarantee and full written instructions.

A wee beastie

I write more in sorrow than in anger — to remind you of the many people who have remained faithful to our ZX81s, that versatile little black box. I value your magazine highly, but haven't seen even a mention of my wee beastie for weeks.

Take no notice of these Johnny-come-lately Spectrum owners and their cries for machine code articles. Devote a corner, instead, to the sinewy little Sinclair and win our undying gratitude.

John Booker
26 Moorside Road
Stockport
Cheshire SK4 4DT

Don't worry, we haven't forgotten the ZX81, though it has been a little neglected of late. The micro that launched a million users is very much alive.

Domestic hint

No doubt thousands of people like myself are fighting a battle with their Vic20 Programmer's Reference Guide. The problem is that the pages seem to stick on the plastic spine. They tear and make the book unpleasant to use (the pages won't lay flat).

However, the problem is easily solved. Spray the spine with furniture polish. The pages turn more easily, making the book much more manageable.

Dave Stamp
22 Fir Rigg Drive
Marske
Redcar
Cleveland TS11 6BT

An easy solution

With reference to Sinclair Spectrum series 3 problems with *In* command, (PCW, 15-21 September), I have an easy solution provided that the program is written in Basic (machine code programs of a commercial origin are generally not alterable by your readers).

For example: 10 Print In

57342: Goto 10 will give the result 255 with issue 1 and 2 machines — and 191 with issue 3 machines.

At each occasion that an *In* command is needed, a preceeding *Out* command will reset the lists set by the ULA. For example: 10 Out 57342,255: Print In 57342: Goto 10 will now give the result with both issue 1, 2 and 3 machines.

So, the solution to Basic programming is quite simple — proceed an *In* command with an *Out* 255 command and any Basic program will work on any Spectrum issue 1, 2 or 3.

W. Smith
25 Swallowfield Road
Sedgley

What is time?

I have just had the oddest I phone conversation with a Sinclair Research lady. It went like this:

Me — I ordered a Microdrive a little over a month ago and I haven't received it yet.

Her — It does take 28 days to deliver.

Me — But it's more than 28 days since I ordered it.

Her — It takes 28 working days to deliver.

Me — What's the difference between 28 working days and 28 days on the calendar?

Her — I don't know.

Me — I ordered a Microdrive a little over a month ago and I haven't received it yet.

Her — Did you send the order form by Freepost?

Me — Yes.

Her — Ah, well, it takes two weeks before we get the Freepost mail, and it is 28 days after that that you will get your Microdrive.

Me — So the ads that say allow 28 days should say allow 28 days and two weeks?

Her — Yes.

Me — So the ads are being a bit naughty saying 28 days?

Her — Yes.

Me — But it was only a week after I ordered it that I got an acknowledgement of order.

Her — Ah, well, you should get your Microdrive next week.

What is time?

Chris Timson
47B Goldsmith Avenue
London E12

Which Computer

I bought your magazine this week in an effort to try to understand the world of home computers with a view to purchasing one for my 11-year-old daughter for Christmas. In view of the financial outlay involved, I want to purchase one which will not be too restrictive and which I would be able to use too.

Your magazine gave me a lot of jargon, programs and I'm sure when I purchase a computer, will give me a lot of help. But, unfortunately, I still don't know which computer to buy. Could you therefore help a future (I'm sure *avid*) reader, and give some advice on what computer to buy.

My daughter uses a BBC model II at school, but I couldn't afford one of those. She has her own 12in portable black and white tv, which I presume could be used as a screen. I have been told by various computer 'buffs' to get at least a 16K micro, to enable it to be used for other things apart from games, as my daughter and, I hope, I become more proficient.

To further complicate matters, my firm (where I am employed) is to purchase a package including ICL DRS 20 model 10 computers, which I am expected to learn to use and to program in Basic as part of my job as an office administrator. So, naturally, I would like to buy a home computer which would be similar in the language used, although I realise that I couldn't expect a direct comparison.

I realise I may have asked the impossible, but I fear I may become the prey of a clever salesman if I venture into a computer shop to get this advice. I could pay no more than £150 for a complete package, but if I were to choose the wrong thing I could ill afford to waste this amount. I look forward to hearing from you in this matter and, as an aside, would add that even for a complete novice your maga-

zine is interesting and informative; even if at this stage, it does only serve to show just how much there is to know and how little I know about where to start!

S Rae
26a Melrose Avenue
Yate
Bristol
BS17 5AL

This is one of the commonest questions we are asked, but it is also one of the most difficult to answer. The choice of computer depends on how much you have to spend and what facilities you want.

With an upper limit of £150 you are automatically excluding the Acorn Electron, the Commodore 64 and Dragon 32 as well as the BBC machine. This leaves you with the Sinclair ZX81 and Spectrum, 16K Oric and Commodore Vic20 to name but a few. Each machine has its own advantages and disadvantages. You would be well-advised to try and get some 'hands-on' experience, either at a computer store or a local user club, before making a final decision.

New Improved version?

Further to the somewhat gossamer letter from Sinclair Research, published in your current issue (PCW October 6-12), if "In accordance with our policy of constantly improving our products, we have from time to time made changes to the Spectrum", what about:

(1) The faulty bit at 006D of the Rom which prevents the use of the non-maskable interrupt?

(2) The dog-end of ZX81 code which got left in between 04AA and 04C1?

(3) The 913 empty bytes between 386E and 3CFF?

Why not put something useful into the last two, like a line renumbering routine?

Perhaps these have been put right in the series 3, I don't know. Luckily I still have a series 2 — which also puts the picture in the centre of the tv screen, unlike the new improved version.

Write your own machine code adventures

Without any knowledge of machine code whatsoever

THE QUILL

THE QUILL is a major new utility written in machine code which allows even the novice programmer to produce high-speed machine code adventures of superior quality to many available at the moment without any knowledge of machine code whatsoever.

Using a menu selection system you may create well over 200 locations, describe them and connect routes between them. You may then fill them with objects and problems of your choice. Having tested your adventure you may alter and experiment with any section with the greatest of ease. A part formed adventure may be saved to tape for later completion. When you have done so THE QUILL will allow you to produce a copy of your adventure which will run independently of the main QUILL editor, so that you may give copies away to your friends.

THE QUILL is provided with a detailed tutorial manual which covers every aspect of its use in writing adventures. It is impossible to describe all the features of this amazing program in such a small space so we have produced a demonstration cassette which gives further information and an example of its use.

This demo-cassette is available at £2.00, and THE QUILL itself at £14.95.

FOR THE 48K SPECTRUM AT £14.95

Our Software is now available from many computer shops nationwide, or direct from us by post or telephone.

VIDEO SOFTWARE LTD

NEW VIDEO-INDEX NEW

Q. How do you store 57,000
characters in a 16K RAM?

A. Use VIDEO-INDEX.

Catalogue your cassettes, your record collection, references to magazine
articles. Amazingly versatile. Capacity for 1,000 individual references each
of which can generate 87 characters of text. Powerful search facilities once
the index has been created.

How is it done?

The system cannot really fit 57,000 characters in a 16K RAM. It gives the
illusion of doing so by eliminating duplicates. For instance in an index of
articles in computer magazines about the ZX81 certain words occur time
and again. VIDEO-INDEX detects these duplications and thereby con-
serves space.

What do you get?

1. A machine code master program which sits at the top of RAM. This is
initially loaded like a BASIC program.
2. A demonstration index containing 1,000 references to articles about the
ZX81 in the popular magazines.
3. A detailed instruction manual.

You may then proceed to create your own catalogues and indexes and
save them on cassette. This program is fast, efficient and ingenious and is
by far the best product we have introduced for the ZX81.

N.B. There isn't room for a commentary on this cassette so you'll have to
read the manual. ZX81 or ZX80+8K ROM. ZX printer is useful but not
essential. Price £9.95

PARAMOUNT SOFTWARE

67 Bishopton Lane, Stockton, Cleveland.

OUTBACK £5.50

For any VIC 20 (Joystick).

Trouble is about to drop in on the occupants of 'Hoppy Valley'
in the form of rather cunning swagmen. 'Ma Hoppy' has a very
sophisticated defence set-up and, with your help, could win
the day. Which is it to be — a tranquil Hoppy Valley or a
swagmen takeover? How long will you survive? It gets tough
and hot in the OUTBACK.

Pure Machine Code action. A game which pulls out all the stops
on the VIC 20 to give you a deceptively aggressive and addictive
challenge. It's a laugh too!

*5 skill levels. *6 Bonus Score symbols. *2 Bonus Life levels.

*Running score on screen. *Hi Score display. *Superb Sound
with 3 different tunes. *Extensive use of colour and graphics.

COUNTDOWN £5.50

For VIC 20, 8K or 16K expansion — Joystick or Keyboard.

Your next assignment is to
assist the government of a
friendly power in averting
a holocaust. TIME is im-
portant. ACCURACY is
essential. COURAGE man-
datory. But, above all,
NERVE is the prime
attribute needed for your
mission as an agent in the
crack S.M.U.

*Multi Skill/Time levels.

*On Screen score display.

*Bonus for each screen.

*"Mission Accomplished"

Bonus.

*Bonus Life feature.

*Hall of Fame.

*Realistic Sound Effects.

*Superb use of Colour and

Graphics.

*Keyboard or Joystick option.

Space Invaders

A new game for 16K Spectrum by Gordon Cooper

This game is great fun to play. It gives invaders which move side to side and come down to get you. You have a single laser cannon to shoot them. As they come lower, their colour becomes darker and more menacing. Let one land and that's the end of that run.

If you blast all the invaders in the first wave, you get a single shot at the mother ship for extra points. Once the ship has passed, prepare for the next wave which comes at even greater speed.

Play against your friend. Your score is shown, together with the highest score so far, at the top of the screen.

The program is written almost entirely in Basic, and uses several tricks to keep its speed up. If you find it too fast, slow it down by adding the *Beep* command. For example, change statement 40 to *Beep .05, -10: Return*.

The key to the program lies in the subroutine at statements 20, 30, and 40. This is dynamically modified whilst the

program is running by statements 2060 and 2070, which blank out hit invaders, and statements 5370 to 5390, which restore the invaders back into the print statements 20 and 30 just before each new wave.

This key subroutine has been placed at the beginning of the program for two reasons. Firstly, it runs faster. Every subroutine call causes the computer to scan from the beginning of the program, looking for the correct line number. If it's found quickly at the beginning of the program storage, the whole game plays faster. The second benefit is that the program may be modified, without moving the storage address of the subroutine. This is vital if the *Poke* statements are to work correctly.

The *Poke* statements work by using the variable *p* to point to the first print character position in statement 20. This is set up by statement 5310. This works by *Peeking* the Spectrum's system variables to find the program start, and then adding 68.

Sixty eight is the number of bytes occupied by statements 20 and the beginning of 30. For this to hold true, you must enter statements 20 and 30 *exactly* as shown. Note that the *Rem* in statement 20 has seven blanks between *past* and *invader*, to make the printout easier to read. An alternative is to remove the *Rem* from statement 20 and change statement 5310 to add only 30 to the *Peeked* value.

The remainder of the program is slightly easier to understand. When initially run, control goes straight to statements 4000 and following. These set up five special characters. You should be able to see their outline in the binary pattern. It's a good idea to enter these first, and run that part of the program to define your characters. Once run, you can enter the remainder of the program, the special characters being entered using graphics mode, and *a*, *b*, *c*, *d*, or *e*.

When the program is running, the next function it performs is to set up a flashing

logo by calling subroutine 9000. This may seem to use rather complex graphics, but gives an amazing display of two flashing coloured invaders. To make it easier to enter, you will find that each print statement is repeated. Thus you may enter each block of graphics once, then edit the line number and print at position to produce the next statement.

While the logo remains flashing, the program then interrogates for name of player, offers instructions and initialises variables. During this set up, statements 5412 to 5419 are skipped over as *m* has been set to 0. This prevents the mother ship being plotted until after the first wave of invaders has been annihilated. Statement 6000 passes control to 375, which calls the subroutine to start the invaders descending.

If the fire button, or the *O* key, have been depressed, statement 360 passes control to 400, the beginning of the laser gun firing routine. A hit is detected by statements 400 and 415. If no hit occurs, control goes from 490 to 310 to continue the invaders descending.

■ the gunfire hits an invader, control goes to statement 2000. Statement 2010 flashes an exploding invader, while 2016 gives sound effects. Line 2020 updates the score, dependant upon the height of the invader. Lines 2060 and 2070 blank out the invader from the relevant print statement 20 or 30. Line 2080 checks to see whether all the invaders have been hit and, if not, loops back to the invader descent routine. If all invaders have been hit, control goes to 5410, after setting the flag *m* to 1.

Statement 5410 was used during the initialisation, but this time has the flag *m* set. This causes statements 5412 to 5418 to fly a mother ship across the screen. Statement 5415 checks for the fire button. When firing at the mother ship, the fire subroutine at 400 and the hit routine at 2000 are used as for the earlier invaders. These routines run an inline code when the invaders are descending, ■ speed their execution. At this later phase of the game they are used as subroutines, by the *m* flag bringing in *Return* instructions at 485, and 2050.

Once the mother ship has passed, control goes via 5418 to 5350, which initialises for another invader wave as at the beginning. However, this time statement 5440 has added another .05 to variable *n*, causing the invaders to come down faster. Eventually an invader hits the base line, detected by statement 390, and control goes to 8000. This flashes the logo as at the beginning, updates the high score if appropriate, and restarts the game.

Before you run the program, it is a good idea to Save it at least once onto tape, as any mistake in the *Poke* statements can destroy your precious program. You can test the *Poke* statements as follows. Run the program, and start the invaders descending. Don't fire at any of them. Press *Break* to stop them, then enter as a direct command *Poke p + 11,143*. Now list the program. You should find the third invader of statement 30 changed to a black square. If the black square is elsewhere, correct statements 10,20 or 5310 until the above test is correct. You're now ready to play. Good shooting. ■

Timex v Spectrum

Ian Logan looks at the US answer to the Spectrum — the Timex-Sinclair 2068

At last, eighteen months after the launch of the Spectrum in the UK, the Timex Corporation of Waterbury, Connecticut, has launched its "personal colour computer — the Timex/Sinclair 2068". With this computer Timex hopes to capture a large part of the home computer market in the US, which is still very underdeveloped in comparison to the UK.

Over the last two years Timex has been selling the ZX81 — repackaged as the TS1000 — on a royalty basis with Sinclair Research Ltd. But, Timex wants to become a computer designer and manufacturer in its own right. It has a large workforce and many factories that are having to diversify as the Timex watch business continues to shrink. The TS1000 gave Timex its first experience of the home computer market and the company decided that continuing investment should be made in the computing business.

When the Spectrum was launched in the UK (April 1982), the management at Timex made the decision — rightly or wrongly — not simply to repack the Spectrum to American standards, but to modify the computer. There is no doubt that the TS1000 is a nice machine. But can Timex still make sufficient profit when relatively

unsuccessful machines are being 'dumped' in large quantities?

Instead of the functional and economic appearance of the Spectrum, the Timex machine has a silvered case (38x19x4 cm) with finely designed lines and mouldings. The keyboard has full-travel solid keys that are certainly easier to use for a typist. To the right hand side of the keyboard is a Rom cartridge compartment — with a lid — into which games cartridges and language cartridges can be slotted and a joystick port.

On the left-hand side of the casing is a 'rocker' On/Off switch and a left joystick port. On the rear of the machine are the tv outlet, the power socket, ear and mic sockets for the cassette player, a monitor output and, finally, the familiar edge connector for the printer, etc.

Underneath the machine is a small channel selector and

There are three definite ways in which the hardware of the Timex machine is different to that of the Spectrum. Firstly, the sound chip. The Timex computer retains the single loudspeaker of the Spectrum but, in addition to being able to 'toggle' the loudspeaker on and off — using *Beep* or *Out* — it is possible to control the output by programming an AY-3-8912 sound chip using *Sound*.

Secondly, the display modes. The hardware of the Timex 2068 allows for four distinct display modes but, apart from Mode 1 (Normal) they are only available from machine code:

Mode 1 — Normal —

one display file of 8K.

one attribute file of 32K.

Mode 2 — 64 characters x 2 colours

—two display files of 8K. (the characters are taken from each display file in turn)

Mode 3 — Second screen

—uses the second display file and the second attributes file.

Mode 4 — Ultra-high colour resolution

—one display file of 8K to hold 768 characters (normal number)

—uses the second display file to hold an attribute byte for each pixel of the characters.

There is no doubt that Rom cartridge programmers will try to make the best of these different display modes.

Finally, the bank switching. The Timex 2068 has been designed with 'extendability' in mind, and this is best shown by the provision for 'bank switching'. In this machine it is possible to use, at any single moment in time, any 8K 'chunk' of memory from any of 256 memory banks — provided that the area 6000-7FFFh is always left alone.

At the moment, only the Rom cartridges use the bank switching, but in time 'intelligent' devices are expected to become available — these will be serviceable without taking up valuable user Ram.

The memory bank 254 is unavailable for use by external devices as it is this bank that contains the Basic extension Rom. This Rom contains code that proved to be impossible to fit in the normal 16K Rom. Therefore, it can be considered that the Timex 2068 has a 24K Basic operating system.

The Timex 2068 uses Sinclair Basic — It

a grill through which one can see the loudspeaker.

Initially, therefore, the Timex 2068 might be considered very different in appearance from the Spectrum, but bear in mind that the keyboard area is exactly the same size on both machines. It is nice though, to have the facilities of the ZX Interface 2 — the Rom slot and the joystick ports — built into the machine.

Like the Spectrum, the Timex 2068 computer uses a Z80A microprocessor running at 3.5 mhz. Also, the tv monitor display is generated, for the most part, by a custom-built ULA — which in the Spectrum is the familiar chip shape, but in the Timex 2068 is one of the 'new' square ones.

is certainly a surprise at first to find a microcomputer that does not look like a Spectrum coming alive with the message:

© 1982 Sinclair Research Ltd
even if it is followed by:
© 1983 Timex Computer Corp

Thereafter, the Timex 2068 acts like a Spectrum. All the familiar keywords are available and the syntax checking, that makes Sinclair Basic so nice to use, works as well as ever.

The Basic has, however, been slightly modified. There are four extra command words and two extra function words. *Delete m,n* (where *m* and *n* must be specified but can be the same) — this command allows for a block deletion of lines from a Basic program. If there is no line in the block then the report *Nonsense in Basic* is given.

It is interesting to note that pressing the *Delete* key in K-mode writes *Delete*, but in L-mode it deletes characters — this makes deleting a line number rather strange (keep the key pressed and *Delete* appears and disappears).

On Err (optional followed by *Goto*, *Cont*, or *Reset*) — an interesting command (taken from Apple Basic?) that allows the user to write error handling routines. Initially, one uses — *On Err Goto line no* — which on execution makes most errors (including *Stop* and *Break*, but not *Goto* past the program) lead to the error handling routine. In this routine one can test the system variables, to determine the error-

register number and *n* a value) — the sound chip has three output channels, and on each channel there can be either a tone or noise. The volume of each channel can be altered independently, as can the frequency of any tone on a channel. The channels can be synchronised by enabling them at the same time. For example, on the BBC microcomputer, all the outputs can be produced with 'attack', 'hold' and

fair estimate of the free user Ram. The Timex 2068 has 48K of Ram, but *Print Free* by itself, gives the result 38652, ie 37½K available for Basic programs.

The other function word addition is *STICK (m,n)* (where *m*=1 for joystick or *m*=2 for pushbutton, *n*=1 or *n*=2, for left or right joysticks). This function returns a value in the range 0-15, depending on the input from the appropriate joystick.

type and error-statement, before correcting the error and using *On Err Cont* to try the erroneous statement once again.

On Err Reset simply cancels the *On Err Goto* state. There is nothing like using *On Err* for making your Timex 2068 hang-up — definitely a case for saving your valuable program before pressing Run.

Reset — a command that clears streams and buffers for peripheral devices.

Sound m,n,m,n... (where *m* is a

'decay' phases.

The *Sound* command leaves the programmer with a lot of work to do, as there is no help from the Basic in the formulation of the appropriate values of *m* and *n*. A last point to be made about the sound chip is that, at least on the review Timex 2068, the sound output is very, very quiet — will this please parents?

The first extra function word is *Free*. This new function returns a value that is a

There is almost total compatibility between the two machines, but care has to be taken with respect of the new commands and functions on the Timex machine. Also, the Basic program area starts at location 23755 in the Spectrum and location 27610 in the Timex 2068. Most machine code programs, of course, will not translate from one machine to the other.

In conclusion, the Sinclair Spectrum is an excellent microcomputer — its popularity proves that — but to be successful, it has had to be produced cheaply. It lacks a respectable keyboard and peripherals have to be attached to a single edge connector.

As to the Timex 2068... well, it is a 'pretty' machine. It has a more reasonable keyboard, but it does clatter. It has better sound, but it is difficult to program and the volume is low. It has less 'bugs' than the Spectrum — many of the easy ones have been corrected (division, *Screen\$*, *Str\$*, "*a*" + 0.1, etc), but not all *Print Int* - 85536 is still '-1'.

The Timex 2068 is worthy of the accolade Spectrum Mark II, but it will be in short supply for a long while yet, as will good software to use with it. I have no doubt that Timex will succeed with its venture, but this country, and especially Sir Clive's Sinclair Research, is still a long way in front.

Contoured patterns

Bryan Skinner shows how 'contour mapping' can produce visual displays

Contour mapping can provide some very pleasing visual displays. This program draws one shape within another, then 'fills' the gaps between with 'contour' lines. For example, given a triangle within a square (Figure 1), the program will produce a pattern as in Figure 2.

The program may appear somewhat complicated, but this is more because of the necessary use of parentheses than much else. In fact, it may be broken down into about seven modules with relatively simple functions.

Three dimension or numeric arrays are used: X, Y and D. Array X holds the x-coordinates of the two figures - $X(1,1)$ refers to the 'first' 'X' point of the outer shape and $X(2,3)$ gives the third 'X' point of the inner shape. Array Y behaves similarly for the Y-coordinates of the two shapes. The two DATA statements at the end of the program define the outer and inner polygons in that order. The data is in the form: $X_1, Y_1, X_2, Y_2, \dots, X_n, Y_n$. Line 20 specifies the number of points of each shape, N1 being the outer. Lines 40-70 simply Read the Data into arrays X and Y and draw the two polygons.

The array D is used to hold the number of the nearest point of the inner shape to each point of the outer shape. This is best explained by means of a diagram (Figure 3).

The 'nearest point' of the inner shape to an outer point is determined by three routines:

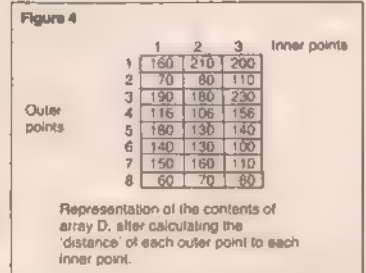

- (i) lines 90-110
- (ii) lines 130-170
- (iii) line 250

(i) line 100 calculates the absolute value of the sum of the differences between the x and y coordinates of a given inner and an outer point. It thus provides a measure of the relative distance of one point from another, ie:

$$ABS(X_i - X_o) + ABS(Y_i - Y_o)$$

where X_i stands for the X-coordinate of an inner point.

Lines 90 and 110 calculate this value for each inner point relative to each outer point, the results being put into array D. The outcome of this process is shown in Figure 4.

(ii) This routine alters the contents of array D by replacing the 'differences' with reference numbers, the smallest difference being given the lowest number. This is shown in Figure 5.

(iii) line 250. This allocates the nearest point of the inner shape to the variable J for line drawing, omitting this line gives some interesting results.

The main part of the program is contained in lines 190-320. To understand these, more diagrams are necessary. Figure 6 shows that the goal is to construct imaginary lines between two points, to divide these in ratios and to link the resultant points. Note that the lines thus drawn will not necessarily be parallel, see Figure 7. The step size is given by line 200 — set at 30, but higher values will increase the 'density' of the pattern by plotting more lines.

The division of the imaginary lines 1-1 and 2-2 is calculated in line 220, to set it to $1/4, 1/2, 3/4$, etc, so that the halfway point of line 1-1 may be linked to the halfway point of line 2-2 and so on.

Lines 270 — 320 function as follows: 270 — calculates A (the next X coordinate) by defining the difference between an outer point's x-coordinate and the corresponding inner point's x-coordinate ($X_i - X_o$). It then multiplies this difference by the current division factor ($1/4, 1/2, 3/4$, etc) and finally adds this to X_o . Line 280 simply rounds the value of A. Lines 290 and 300 perform similar calculations for the points' Y coordinates to define the next Y coordinate as $(Y_i - Y_o) * ST + Y_o$.

A and B thus define the next point to which a line is to be drawn. Line 310 uses the Dragon command Line, missing the first parameter, which causes a line to be drawn from the end of a previous line to the coordinates given.

You should be able to create some interesting patterns by altering the shapes defined by the Data statements in 340 and 350 — but don't forget to alter N1 or N2 in line 20 if you change the number of points of either figure. Note that the inner shape must have fewer points than the outer and that the points must be given in the Data statements in clockwise order, or odd effects will occur.

As mentioned above, altering the value of S in line 200 will alter the closeness of the contour lines drawn. Finally, changing the Pmode and Screen variables in line 10, and perhaps adding: Color And(4), Rnd(4) to line 310 should yield some colourful results.

Some users might find alternative uses for some of the modules; for example, the routine in lines 130-170 could be used to rank a set of data prior to some statistical calculations.

A slice of the pie

Richard Dodd explains how to draw a pie chart on the hi-resolution screen

This program for the Dragon 32 computer draws and labels a pie chart on the high resolution screen. Most of the program is used to store the characters that need to be drawn to the screen.

To draw the characters on the hi-resolution screen, the program uses a small subroutine. The words to be drawn are put in a string which is divided up by the subroutine. Each of the characters is

read and its ASCII code is determined. This code is used to find the appropriate character to be drawn.

The program uses sine and cosine to work out where to draw the lines and the pie chart. There are 720 points round the circumference of the circle, so two points represent one degree.

The values you enter will be printed on the screen, alongside the percentage of

the total they represent. The total and a title are also printed on the screen.

Notes

- 10-50 Prints instructions
- 60-70 Clears string space for the characters
- 80-110 Special characters
- 120-220 Numbers
- 230-480 Letters
- 490 Waits for continue
- 510-600 Inputs values and labels
- 620-790 Draws and labels pie graph
- 800-870 Prints all the values you entered and the percentage each is of the total
- 880-890 Prints the title
- 900-920 Prints the total
- 930 Freezes screen
- 940-1020 Subroutine to draw characters

Accessed functions

A Servini presents a program to access scientific functions from machine code

One of the disadvantages of Basic is that it is so slow, as any serious games programmer should know. Machine code is fine as far as speed is concerned, but lengthy assembler or hex coding can be tedious.

To overcome both problems, I recently bought one of the Basic compilers currently available on the market. However, these have the disadvantage of not being able to handle scientific functions, as they are integer compilers.

So, here I have dipped into machine code, to develop a small routine to interface between compiled Basic and the scientific functions handled by the calculator subroutine within the Spectrum Rom.

The compiler is only able to handle integers between -32768 and 32767. This data, when converted to its binary format, occupies two eight bit bytes. To access this from machine code, the data must first be Poked into a two byte area of Ram.

The machine code routine then Loads the data into the C and D registers. The C register is then tested for either a set or reset sign bit — and, accordingly, the E register is Loaded with either 255 for a set bit (255 is two's complement for -1), or zero for a reset bit. This is done because of the way the Spectrum holds integers within its calculator "stack", as these are held as five bytes on the "stack" (floating point numbers are also held as five bytes).

The order in which these are held is.

| BYTE | INTEGER FORMAT |
|------|--------------------------------|
| A | Always zero |
| B | Always zero |
| C | High byte (holds the sign bit) |
| D | Low byte |
| E | Either zero or 255 |

These correspond to the A, B, C, D and E registers, which are Loaded with these bytes, and passed to the "stack" via the Rom "stack-store" subroutine (2AB1 hex).

In the following machine code routine, the first number represented in integer format is the constant 32767 — after this is the data and finally the constant 1000.

The five byte numbers are stacked in this order because the calculator "stack", operates on a last in, first out basis. When the calculator performs an operation on the two top numbers on the "stack", the stack decreases by one, and the result is put on top of the stack.

The calculator is then called up by the RST 002Bh instruction. The five literals which follow in the machine code routine call up the calculator functions (such as — Add, Divide, Sin, To Power, etc). The calculator is terminated by the literal 3Bh, and the result (now on the top of the calculator "stack") is retrieved via the "stack-fetch" subroutine (2BF1h) which passes the result to the A, B, C,

D and E registers.

Only the C and D registers are required, however, as the A and B registers always hold zero for integers. Also, the E register is not required, as compiled Basic will automatically assign a negative value to the final result if it is greater than 32767.

The two constants are used to manipulate data to and from the machine code routine, because the compiler does not handle fractional values. So, if significant places are not to be lost after the decimal point, a number such as 3.786 can be input as 3786, and divided by 1000 from within the machine code — this is then presented to the Sin function as 3.786. The final result is also passed to Basic as a number between -32767 and 32768 which represents a number between -1 and +1.

The machine code routine as it stands can only perform one function, namely Sin

x. However, further modification could be done where the literals are stored in a table, and loaded as required into the address which corresponds to the required literal. For example, the literal 20h could be substituted for 1Fh and the routine would perform Cos X, etc.

The routine as written, loads into the printer buffer area in Ram (5B00h). For those who want to move the routine into the user graphics area, change the start address to 7F59h, Loop to 7F70h, First and Doul to 7F8Eh. In the following Basic routine, change 23350 to 32654, 23351 to 32655, and 2396 to 32600.

Finally, here is the Basic routine required to Poke the input data to the machine code routine, and also to Peek from machine code the result of the calculation:

```
100 INPUT "number?":B
110 IF B<0 THEN LET B = B + 65536
120 LET A = INT (B/256)
125 LET B = B - A*256
140 POKE 23350,A
150 POKE 23351,B
160 LET MC = USR 23286
170 LET A = PEEK 23350
180 LET B = PEEK 23351
190 LET A = A*256 + B
200 PRINT A:STOP
```

An assembler listing of the machine code routine.

Displayed text

David King explains how to write a titles program for video

As explained in Andrew Homer's article *Letters of Credit* (PCW, 15-21 September), time and money can be saved by using a computer connected to a video recorder to record captions or messages rather than adhesive lettering in front of a camera. Using a computer program can also make synchronisation with music particularly simple: the operator can listen to the chosen music and press a key on the appropriate beat, causing either a number of lines to reveal or the page to change.

The program in Listing 1 is well suited to this use. Starting with a blank screen, lines of data are shown whenever the space-bar is pressed. Looking at how the data stored reveals at line 500 the number of complete pages in the sequence, which is read and used at lines 40 and 50. The following lines of data are read at line 80. Variables X and Y represent the horizontal and vertical position at which the lines of text stored in the variables *Words\$* will be printed. If *Pause\$* is "Y" then the display will pause until the space-bar is pressed; if *Pause\$* is "N" then the next line of that page will be printed. If *Double\$* is "Y" then that line will be printed at double height.

What does take time with a program like this is calculating the values of X and Y for

each line. This normally entails breaking into the program several times to alter the values. One way round this is to have a program that works out the values for you. This week we will look at two procedures that quickly make these calculations. Next week we will fit the programs into a master program which, after evaluating your inputs, creates and records a new program on to cassette or disc. The generated program will be the same as Listing 1, but with your own data recorded.

The cursor control keys with their clearly marked arrows are the obvious ones to use for positioning text on the screen, but they do not normally give a code when pressed that is recognisable to a Basic program waiting for an input. The inclusion of the command *FX 4.7* in the program will make the cursor keys give ASCII numbers: 138 for down, 139 for up.

The procedure in Listing 2 starts by positioning the cursor at *Tab(4,10)*, where we can see it clearly. Pressing the arrows for up and down either adds to or subtracts from the value of Y. If you try to go off-screen, the computer makes a noise (VDU 7). The computer ignores other pressed keys, except the *<RETURN>* key (ASCII value 13) which terminates the procedure.

Now the vertical position (variable Y) is finalised, the second procedure (Listing 3) calculates the value of X. All users have to do is type in whatever they want to see displayed. The procedure automatically prints the line in the centre of the screen, producing the rather entertaining effect of words growing out from the middle of the line as you type. The variable line indicates the number of the text line being created.

The variable *max* at line 490 should contain the maximum number of letters per line: this is 39 in mode 7 and 19 in mode 5. Although we are dealing with text, line 530 produces the ASCII number of the key pressed rather than a string. This is so that the procedure can detect the return key (13) or delete key (127) being pressed.

Line 560 copes with stripping *Words\$* of the last character when the DELETE key has been pressed. When appropriate, line 570 adds a character to *Words\$*. The line of text being processed is kept in the centre of the screen by lines 580 and 610.

We now have two procedures for positioning text: the end of the second procedure sets the reveal delay variable *Pause\$* for the line. Next week, we look at *PROC-saver*, how it creates and records the display program, and provide a listing of the whole of the master program.

CHOOSING A HOME MICRO

WARNING

Choosing a home micro can be a daunting task to the newcomer, and with an ever increasing number of micros emerging on the market, even up-grading, say, from a ZX81 can be a risky and expensive exercise if the wrong decision is made. It is important to look at the real facts and specifications, and check exactly what you get for your money before choosing your micro-computer system.

THE PITFALLS

"DON'T LET THE ADD ONS ADD UP"

A number of large companies are offering packages that seem to be good value and low cost. These offers usually have a hidden sting inasmuch as the essential accessories such as connection leads, peripherals and software often carry very high cost premiums. The software for low cost hardware usually costs between £29 and £49 for a ROM cartridge!!

CHECK THE QUALITY OF THE PRODUCT.

Raw materials are now an area where corners can be cut, and shoddy workmanship during 'building' can affect the up-time of your unit. Areas to watch out for are unreliable edge connectors, corrosion and poor quality PC B's. Low quality components and bad design will seriously affect the reliability of the end product, and can lead to false economy.

DON'T BUY A GAMES MACHINE

Unless you want just games and nothing else! With a games computer you are limited. Some computers, however, have the advantage of both games facility plus the whole world of computing to explore, as your interest and skills develop. A real computer system will allow you to expand your knowledge of the Hi-Technology world, and help earn its keep with its added uses in the field of education, communication and home business use.

SOFTWARE

Make sure the system you choose has a growing library of support software, to enable you to realize the full potential of your machine.

KEY POINTS TO LOOK FOR

● High Resolution Colour

In general most home computers have a poor graphics resolution (or detail). Check on the vertical and horizontal resolution in graphic mode and multiply the two numbers together. If the result is less than 35,000, then the graphics can hardly be considered high resolution. Without high resolution graphics displays such as those used in games tend to be 'Chunky' in appearance.

● High Quality Sound

Some computers claim to provide a sound channel when in reality all that can be found inside the computer is a small buzzer controlled by electronic pulses. At the very least a sound facility should provide more than one channel and a noise channel as well (for gun shot effects in games for example). The best systems also provide envelope control of the sound channels to produce very sophisticated effects, very important for generating music. Also look for the ability to connect to external amplifiers.

● Keyboard

For accurate entry of programs and data into a computer it is important that the keyboard has a good tactile feel in operation. Coupled with acoustic feedback the user is fully aware when the computer has accepted his instructions. Also of importance is a keyboard layout. A standard computer keyboard layout will familiarise the user with the vast majority of computers used in the world of business and professional applications, very important if the purpose of purchasing a computer is educational.

● RAM

One of the most important features of a computer is the amount of RAM, or memory, included. In general the more powerful and exciting a computer program is the more RAM it requires. But take care, all computers are advertised quoting the total RAM used in the system. Computers use up a great deal of their own RAM for storing essential data and particularly in supporting the graphics display and the CPU. If it is less than 32K think again, is it enough?

● Computer Language

It is too difficult to program a computer in its own binary language so high level languages are used, the most popular being BASIC. However, there are a number of BASICs, some being very different from the rest. A de facto standard in the computer industry is Microsoft BASIC. Learn this one and you will be able to program in the majority of computer BASICs, such an important point if a home computer is to be used to educate your children to face the technology of the future.

● Expansion

As your interest and knowledge of computing grows, you will need a

Choosing the right system involves careful selection of hardware, software, and peripherals. Check full specification, plus peripheral and software prices, before you buy. Preferably choose a real computer system that can expand to meet your needs.

computer system that will grow with you, able to accommodate Printers, Disk drives, Joysticks, Communications Modem, and Colour Monitor, as well as produce Hi-Fi sound effects.

● Software

The computer you choose should have a growing selection of utility

software to make the most of its capability. Remember, computing is here to stay. You can't learn to compute on a toy or a device which does not behave like a real computer. In short, look out for a computer which offers all the points above, and you will be sure of getting the best value for money.

To find out which company offers you the right choice, with:-

- Good value, high specification, quality micros.
- A quality, 4 colour, plain paper printer/plotter.
- Communications Modem.
- Micro Disk Drives.
- Comprehensive and growing range of software

TURNOVER... ➡

ORIC-1

The Growing System

ORIC-1 MICRO FLOPPY DISK DRIVE

Coming soon the incredible new 3" Oric Micro Drives. Small size, Compact. High precision disks with storage capabilities from 100K Bytes to In excess of 1 Megabyte. Unformatted. With their own built-in power supply, these easy to use units will add big system capability for our home micro.

ORIC MCP 40 COLOUR PRINTER/PLOTTER

The Oric Colour printer is quality engineered to provide 4 colour hard copy on plain paper, with superb graphics and text capability, printing either 40 columns or 80 columns. It prints in red, green, black and blue, onto 4 1/2" width standard paper roll. With a print speed of 12 characters a second, the MCP 40 comes with its own power supply and all necessary leads to connect straight into your Oric or to any standard Centronics interface.

This superb printer represents excellent value at just **£169.95 including VAT.**

The right choice for real computing ORIC-1

Before making your final choice, check any other home micro in the same price bracket against the incredible specification of the ORIC-1.

ORIC-1 Setting today's standard in Quality and Price.

ORIC-1 48K £139.95 inc. VAT **ORIC-1 16K £99.95 inc. VAT**

All ORIC Computers purchased before 31st December 1983 come with a £40 voucher off the M.R.P. of the MCP 40 Colour Printer. **MCP 40 COLOUR PRINTER £169.95 OFFER PRICE £129.95.**

TANSOFT ORIC Software

The fast growing success of ORIC-1 means an incredible number of software titles are becoming available for your Oric. With many well known titles from independent software houses, plus exclusive ORIC SOFTWARE from TANSOFT, you can now drive your Oric towards its full potential.

Below is a small selection from Tansoft's range of software titles. Super value!

BUSINESS

ORIC BASE, ORIC CALC, AUTHOR, MACHINE LANGUAGES

FORTH, ORIC MON,

COMPUTER GAMES

ZODIAC, HOUSE OF DEATH, ORIC MUNCH, SUPER BREAKOUT, ULTIMA ZONE, DEFENCE FORCE.

TOURING LANGUAGES

GERMAN, SPANISH, ITALIAN, FRENCH

GENERAL INTEREST

ORIC CHESS, MULTIGAMES 1, MULTIGAMES 2, ORIC CAD, THE NOWOTNIK PUZZLE.

TANSOFT ORIC SOFTWARE available from your ORIC supplier and all good software dealers. For full list of further information contact:-

*Prestel and the Prestel symbol are trademarks of British Telecommunications.
*Subscribers are responsible for quarterly Micromet 800 and Prestel subscription charges.

Micronet 800. The spectacular service that gives micro-users access to a huge database of information, hundreds of software programs, and communication with other users.

Sinclair ZX Spectrum. The home computer that's out-shone all its rivals.

Bring the two together and it's a combination that opens up a breathtaking new world of microcomputing possibilities.

Suitable for either the 16K or 48K versions, the Prism VTX 5000 modem was designed specifically for the Spectrum and fits neatly under the micro.

Plug the other end into the outside world via your telephone and your system will give you more than you ever dreamed possible.

Micronet 800 is fun, friendly and inexpensive to run.

Choose from hundreds of free games, download and use them on your Spectrum whenever you like, play on-screen games (as easy – and inexpensive – as a local phone call), and compete in Big Prize games and quizzes. There's also a range of downloadable games you can buy for less than over-the-counter prices.

Learn through up-to-date education packages, and help run the household with simple business packages.

And if you need fast facts about the world of computers, Micronet 800 provides constantly up-dated product comparisons, reviews, prices, dealership and 'best-buy' information – 24-hours a day, 7-days a week.

You can also access the full range of Prestel information covering news, travel, holidays and entertainment, together with an electronic booking service.

Keep in touch – you can send electronic mail to any other Micronet 800 or Prestel user.

The VTX 5000 provides a full Prestel screen with graphics, and an off-line message composition facility for speedy transmission when you go on-line.

You can use the Sinclair printer to print frames and messages, or save them on tape for future use.

All this – and even more as the service grows – retails at the low price of £99.95 inc VAT.

Plus, as a special offer to early users, we will provide you with a jack-socket installation (should you need one) completely free of charge.

So don't delay – send the coupon today.

TURN YOUR PROGRAMME UPSIDE DOWN

Now you can add another dimension to your games.
Swap direction, swap functions, confuse your friends.
In fact you can add almost any twist to your games with
Stonechip's Programmable Joystick Interface.

You can also listen to them
with Stonechip's Echo Amplifier.

Programmable Joystick Interface. This also enables any Spectrum software to be used with a joystick, irrespective of which keyboard keys have been chosen for function.

Programming is easy using only a single switch. Switch one way to program and another way to play. No tapes to load or links to worry about — all programming is achieved by hardware. Used with Atari-compatible joysticks. Simply plugs into rear expansion port of ZX-Spectrum. No other connections to make, no additional power supply required.

Echo Amplifier. How would you like to listen to the sound output from your ZX-Spectrum without ear strain? The Stonechip Echo amplifier can do this for you as well as easing the tedium of saving or loading of tapes and enlarging the range of tape recorder compatibility with the computer. The amplifier has volume control over a range adequate for most uses, and a tone control for harsh or mellow sounds. A switched interface removes the need to swap leads during 'SAVE'ing or 'LOAD'ing. Leads are left connected all the time and the desired function selected on the three position switch by the user. Use of the 'CUE' facility enables an audio cue to precede the program being 'SAVE'd' on tape, a decided advantage when searching through a multi-program tape. The Echo simply plugs into the Ear, Mic and Power sockets of the computer and does not require an additional power supply. The expansion port at the rear of the computer is free for use with other peripherals and the unit is housed in an attractive case custom designed to complement the ZX-Spectrum

Mathematical quiz

Les Allan presents a program to test your mathematical skills - Little Professor

Little Professor for the Commodore 64 uses the hi-res screen to draw the face of a 'professor' and text for the questions on arithmetic.

The menu at the start of the test allows the 'pupil' a choice of 10 questions from one of the four functions and nine skill levels available. Three attempts are allowed at each of the 10 questions - the correct answer is given should the 'pupil' still fail to answer correctly.

Upon completion of all 10 questions, the menu gives the following options:

- F1 further test on same function
- F7 change function and or skill level
- selects cold start

■ selecting F1, the skill level is increased up to a maximum of 25 for each time 10 correct answers have been made.

Answers should be made to each question in the same manner as the 'pupil' would enter them into text books. These are from right to left and as 'units', 'tens', 'hundreds' etc. Should an incorrect entry be made, the number can be deleted by pressing the *Del* key - the sum ■ entered with the *Return* key.

The choice of a hi-res screen was made so as to provide some initial interest in watching the make up of the face; it also allows ease of controlling the size of the character set and makes a more presentable program. Text commands are repeated, so as to allow the information to be written and then erased. A simple screen clear would entail redrawing the original face again.

As the level of difficulty increases, the location of the question is moved to the right by one pixel for each skill level. Also, it is only possible to enter as many digits as there are numbers in the correct answer.

The *Run/Stop* and *Restore* keys are disabled during the program in order to prevent accidental stoppage of the completed program - it takes several minutes to fully set up the initial screen. I strongly recommend that *Poke 808,225* be omitted from line 16 until the program ■ fully working and saved. However, during the operation of the program, selection of F8 after 10 questions have been answered will enable a break to be made. This will of course reset the computer, but 'olding' prior to a new line number being entered will retain the original listing. You have been warned!

Notes

- clear screen, disable run/stop and restore keys clear variables
- 18 selects hi-res screen, colour cyan with blue plotting colour
- 20-74 draws picture of professor
- 80-104 introduction text
- 112-124 select required function
- 130-150 select skill level

- 158-172 select random questions
- 174 checks number of questions answered
- 176 calculates number of digits in answer
- 182-190 print X
- 196-202 print Y
- 204 print function
- 206 draw line to length of maximum number
- 208 check to see if screen is being cleared
- 210 clear keyboard buffer
- 216-232 keyboard entry
- 220 deletes last number entered
- 222 executes sum ■ entered answer
- 228 checks length of keyboard entry against answer
- 230 print keyboard entry
- 238-244 calculate answer and check if correct
- 246-254 print WELL DONE for 2 sec
- 256-258 update number of correct answers: clear screen
- 264-274 print 'WRONG TRY AGAIN' for 1 sec
- 276-278 update number ■ wrong attempts: retry if less than 3
- 280-290 print correct answer if number of attempts is greater than 3 for 1 sec
- 292 clear screen
- 298-320 print result of 10 questions for 5 sec
- 324 increase skill level if all 10 correct
- 326 reset variables

- 328-342 print menu ■ and ■ each 10 questions
- 350-366 perform outcome ■ menu
- 372-378 delete character routine

Variables

- K number ■ entries
- P function key pressed
- X initial value of QX
- Y initial value of QY
- AN initial value of XT
- CA number correct answers
- CC counter in printing result
- CP initial value of CA
- CS clear screen
- LL length of line used during printing of question
- QP poke code for function required
- QA number of questions answered
- QT initial value of XT
- QX random value for first part of question
- QY random value for second part of question
- RP repeat an operation
- SK range ■ random numbers from 0-SK
- SL skill level value
- SU SUM of question by 'pupil'
- VR variable used ■ multiplication and division
- WR number of wrong numbers
- XX counter in printing QX
- XY answer to question set
- YY counter in printing QY
- C1 LSB of CP
- X1 LSB of X
- X2 LSB of OT
- X3 counter in printing correct answer
- K5 keyboard entry
- SL5 skill level entry
- N(K) used in printing keyboard entry

At last...

A joystick that works!

Cambridge Computing bring you the first **programmable** joystick ~ at a price you can afford.

The
intelligent
Joystick

£29⁹⁰

JOYSTICK, INTERFACE
AND TAPE COMPLETE

Interface

- 1k on board memory
- Own rear edge connector — for printers etc..
- Compatible with all standard joysticks

Joystick

- Self centring
- 8 Directional microswitched action
- 2 independent fire buttons

Tape

- Easy to use program enables the interface to work on ALL software
- Keeps a record of all your games — so you only need to tell it about each game once!

CAMBRIDGE COMPUTING

1 Benson Street, Cambridge CB4 3QU
Telephone 0223 322905

Please send me:

Joystick, Interface and Tape at £29.90

Interface and Tape at £24.00

Joystick only at £7.00

For Spectrum

I enclose cheque / postal order* for £.....
made payable to Cambridge Computing Limited.

*delete as necessary.

OPEN FORUM

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Hangman

on Dragon 32

Although only twenty words have been included to demonstrate the programme.

words may be added by changing the 10 in lines 10, 20 and 100 to the number of words in the data lines from 2000 onwards. To aid the younger players the alphabet is displayed and the letters are deleted as guessed.

Program notes

Lines
10-30 and
2000- Set up dictionary
100-200 Select word and set up screen
300-340 Input letter and check if already used.
350-360 Clear letter from alphabet display
390-460 Check for letter in word and check if word complete.
500-1020 Letter incorrect, draw next part of hangman

Hangman
by Brian Beasley

Pounds

on BBC Micro

This small program is for those people who own a BBC Micro and a Tandy CGP-115

Colour Graphic Printer, and who need an adequate pound sign without resorting to a special graphic routine.

The important features are as follows:
Line 10 enables the printer.
Line 30 prints a left square bracket, back-

spaces, prints an equal sign, back-spaces again and finally, underlines.

The rest is for the lucky pools winner or dreamer only!

The final effect is a quite convincing pound sign.

LIST

```
10 VDU2
20 PRINT""ONE MILLION POUNDS""
30 VDU1,91,08,61,08,95
40 PRINT"1,000,000.00p"
50 VDU3
```

RUN
"ONE MILLION POUNDS"
£1,000,000.00p

Pounds
by M J New

City Bomber

on Oric

This program was developed from an original version of the Vic20. The object of the game is to destroy the buildings before you are destroyed.

Every time you succeed in landing, a flag will be displayed at the bottom of the screen. Additional points can be accrued by using as few bombs as possible.

There is a high score facility as well as full colour and sound effects.

Variables

■ Height of plane

X Horizontal position of plane
Y Vertical position
B Set whilst bomb drops
S.V Horizontal fix, Vertical of bomb.

Pokes

BC49,0 Sets foreground colour to black
BC99,7 Sets foreground colour to white
B7E9-B7E7 Stores graphic characters

My word they are addictive! Dragon's Teeth
The sound is very good indeed and the graphics are outstanding! Popular Computing Weekly

LATEST RELEASE — AVAILABLE NOW
MAURICE MINOR

Out for a quiet drive in your Morris Minor when you inadvertently wander on to a race track and find yourself in the middle of a Grand Prix. To turn back against the other cars would be suicide. The only thing to do is grit your teeth, grip the wheel, put your foot down and make for the finishing line and safety. If you can avoid the crash barriers and oil slicks, drive fast enough to avoid being run over by Mario and Nelson behind you, then you can think about overtaking the cars in front. Can you make it before your car falls to pieces? Another superb Arcade style game with animated high resolution colour graphics and sound. Requires one joystick.

A very fast action with accelerator, damage report, timer, six levels of skill and half of time. SUPPLIED ON CASSETTE £6.95

All orders despatched by return 1st class post

Galactic Intruder

on Atari

This program puts you in charge of a

missile base armed with ten shots. An animated invader moves across the screen moving downwards.

Each time you hit the invader your score will increase by ten, but beware — one hit from the invader is lethal.

WIN THE POOLS?

SPECTADRAW 2 — THE BEST SELLING POOLS PREDICTION PROGRAM FOR THE 48K ZX SPECTRUM

The program looks at the recent form of the teams playing in each week's English and Scottish football league matches and then refers to a large database to see what has happened in the past when teams with similar form met. By combining the lessons learnt from the past with the teams' current league position, the program generates a draw probability factor for each match. It can then identify the matches which are likely to yield draws and output suitable predictions. It will also output the least likely draws for the benefit of those who prefer the fixed odds lines on coupons.

Program, 8000 match database (both on high quality cassette) and instruction manual £12.95 inclusive.

NEW!! SPECTASORT — THE PERM GENERATION PROGRAM

Spectasort takes the 14 most likely and 14 least likely draw predictions and produces ten 8 from 10 full over perms, enabling you to complete your pools coupon directly from the screen. The program will run on its own in 16K, using your own predictions, or has the unique feature of being able to merge with SPECTADRAW 2 to provide a complete Pools Prediction package!

Spectasort program on high quality cassette £4.95 inclusive.
(Cheques/POs payable to B.S. McAlley)

DRAGON USERS CLUB

Why be the Dragon Club at the Dungeon the largest independent D32 User Group, with members scattered through 24 countries? What do you get for your subscription?

- The monthly club magazine 'Dragon's Teeth', with 16 pages of solid information, News, views, advice and the latest reviews. Competitions with worthwhile prizes (fancy a year's free software?), special offers, machine code info and news of the US 6809 scene.
- Free members' advertising in 'Dragon's Teeth'.
- Free copies of all Dungeon catalogues.
- Big savings on both software and hardware.
- Free advice service.
- Publishing service for hot-shot programmers.
- Free listing service for members without a printer.

ANNUAL SUBSCRIPTION: UK £5.00
Overseas £8.00

DRAGON STICKS

If you want the latest switch-type, self-centring joysticks (best for the up/down, left/right arcade games), we've got them at £19.95 per pair.

If you want the famous 'Quick-Shot' aircraft-type sticks (no expensive adapter required), we've got them at £15.95 each.

But if you want the ultimate analogue sticks, with the best fire button available, then you have to get DO Dragonsticks (£19.95 per pair). Quotes from satisfied customers:

"Already my top score on Ghost Attack has almost doubled!" — Dr R. M. D.

"Miles better than my previous joysticks" — Mr J. M.

"My other analogue sticks seem crude by comparison!" — Miss R. T.

LATEST BEST SELLERS FOR THE DRAGON 32

PACORIDS (Programmer's Guild) £8.95. Combine 'Falcon' with 'Defender' and add destructo mines and superbombs and you begin to get some idea of this 100 per cent machine game. Money-back warranty.

DRAGUNNER (Cable) £8.75. Our favourite 'Frogger'-type game (this one fires back).

CAVE FIGHTER (Cable) £8.75. At last a good 'Skramble'-type game for the Dragon! 100 per cent machine and miles and miles of caves. Forde fields, bombs, laser cannons, fuel dumps, contra-rockets and the classic problems!

CRUSADER (J. Morrison Micros) £8.95. Now UK machine programs have Tom Mix standard graphics! Morrison's best arcade game yet, unique, but with a 'Hunchback' flavour. Eight screens, but nobody at the Dragon has got beyond six yet! We are torn between this and 'Naga Warrior' as our favourite arcade game! (But THE best sellers are still 'Pirates' and 'Ring of Darkness'.)

CRYSTAL CHAUCER (Dungeon) £7.95. Mike Mainack's epic adventure in the doomed Kingdom of Quorum. Much cunning required (cheat-sheet available on request).

MICRO RADIO

This is the first in a series of articles designed for radio and microcomputer enthusiasts alike. If you have any queries that you want answered, hints and tips to share, or topics that you would like to see covered, write to: Ray Berry, Microradio, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

GW6JUN

With two or three million home computers in the UK, it is reasonable to assume that microcomputing as a hobby is here to stay. An older, but equally hi-tech hobby, is amateur radio and short wave listening (SWL). When citizens band radio was made legal two years ago, the number of people with radio equipment soared into the millions.

Radio and computers complement each other in so many ways that it was obvious that many radio enthusiasts would turn to the home computer to enhance their hobby. With the possibilities of networking and the transmission of programs and data over noise-free amateur radio frequencies, computer enthusiasts will hopefully turn to amateur radio to enhance their interests.

The purpose of this column

is to provide a forum for those interested in radio and computing. It is also hoped to be an introduction to radio and the exciting world of satellites and moonbounce — making sense of all of those strange noises that can be heard on a radio receiver.

In this column we shall discover how to track the moon and plot the course of the space shuttle. We shall make sense of amateur and information satellites and find out how to send amateur television on a microcomputer.

As I have said, the column is in the style of a forum for you to send in your ideas, your questions and your routines. I shall be looking at morse code, RTTY, satellites and even the possibilities of sending your own personal teletext pages to your friends. There will be reviews of relevant software, hardware and books. There will be information about radio-computing user groups and much much more. This is the column that will take you and your computer into the space age. See you next week on this frequency.

Ray Berry GW6JUN

6,000 FREE TAPES TO BE GIVEN AWAY

Sunshine is giving away 6,000 software tapes — for free. All you have to do is cut out and fill in this coupon, together with the coupons in the last four issues. As soon as you have collected five coupons, post them to:

Popular Computing Weekly Tape Offer
12-13 Little Newport Street, London WC2R 3LD
But, remember you are limited to one tape per person and there is a limit of 1,000 tapes per game.

Rules

- 1) Each entry must consist of five coupons cut from the magazine
- 2) You may only order one tape per person
- 3) There is a limit of 1,000 tapes per game
- 4) No correspondence will be entered into
- 5) No employees of Sunshine Publications Ltd, or their families, will be eligible to enter

is left may be a corridor, to his right a wall and before him, a door. He can't, of course, go to the right, but he may choose to go left along the corridor, in which case the screen will clear, and the player find himself at the next location. Should he choose to go forward to the door, he (or she) will be given the choice to either open the door, or listen at the door.

The first option is for the brave or bhardy — the more cautious go for the second option, in which case, the player will be given information about what lies in

(3) Brian Foote, who reckons his 97.5 percent is a record. Apart from the odd, rogue 215 percent, I think he may be right (unless you know better), and he included a data tape to prove it.

- (4) George Findlay
- (5) Christopher Kenworthy
- (6) Bret Sampson, who then wrote 83 after his name — whether this is an allusion to his age, or the year, I know not!
- (7) Russell Lewins, who had to work very hard!
- (8) Tony Aspinall

stuck.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to: Tony Bridge, Adventure Corner, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Tony Bridge's Adventure Corner

Hall of fame

Another look at recent Spectrum adventures with a trio of programs from ASP Software. The same people, you may remember, publish a well-known, old-established monthly computer magazine, as well as *The Valley*, for which I still have a soft spot. The first, *Detective*, is really not an adventure, but a cerebral game, with its basis in *Cluedo*. It is very colourful, and can be played by 1 to 6 players. The mechanics of play are quite simple — dice are thrown, and the players move around a small, 3 x 3 area, picking up clues as to the scene of the crime, the perpetrator, the murder weapon, and the motive.

In *Mastermind* fashion, the information is put together, and a process of elimination should, in the end, reveal all the answers. A good program for the kids.

The second tape I have from ASP is *Cats*. This is from the *Wumpus* branch of adventure, in which the player moves around a Dungeon complex, usually listening at doors for monsters, and picking up gold pieces and other treasure. The original *Wumpus*, all the player had to do was to triangulate on the *Wumpus*, a mythical monster, with the aid of tactile clues as to his whereabouts. Later versions allowed the player to flash a torch before him, to discover what was in the neighbouring rooms, or fire an arrow to clear a path.

Now the details have become ever more distanced from the original — first published, as far as I know, by David Ahl's *Creative Computing* magazine, back in 1980 or thereabouts.

In the present game, the player is presented, at each turn, with the layout of neighbouring locations. So, for instance, to his left may be a corridor, to his right a wall and before him, a door. He can't, of course, go to the right, but he may choose to go left along the corridor, in which case the screen will clear, and the player find himself at the next location. Should he choose to go forward to the door, he (or she) will be given the choice to either open the door, or listen at the door.

The first option is for the brave or foolhardy — the more cautious go for the second option, in which case, the player will be given information about what lies

wait on the other side of the door. Before opening the door, he may see his present status — this is a table of treasure held, hit points, monsters slain so far, and so on. Basing his choice on this table, the player may open the door and do battle, or leave well alone.

Another choice awaits the player on opening the door, and this is — fight or retreat? In my experience, the monster will attack whatever is decided, and much of the time will be beaten, no matter how weak the player is (could be pure luck). The program is in Basic, so the responses are a touch slow, but the screen display has had a bit of thought put into it and is quite colourful.

The last ASP program is *Demon Knight*. This is a text adventure in the traditional mould. Again in Basic (incidentally, I certainly don't hold with the idea that Basic games are not worth looking at — a well-written Basic program should suffice for a text adventure). This program, however, is very badly presented, being full of elementary spelling mistakes that ought to have been found out by the game-testing stage. The text is badly justified, and the screen layouts are generally messy. The player is even asked to set the *Caps Lock* before playing! Have a Peek at 23658 some day, fellows!

The adventure itself is set in a castle, and is the usual mix: "You are in the Throne Room — you see ..." etc. Only two word commands are accepted, although *Help* will elicit a response. No doubt the inherent puzzles (how to get to the secret of the rubbish pile and so on) are diverting, but the incorrigible cheat can easily break into the program, and find many of the answers displayed.

All in all, not a very exciting release from ASP and they all have the flavour of old ZX81 games — the three programs together on a compendium tape would be good value, however.

On to The Hobbit Hall Of Fame, and there are quite a few new names to be blazoned on the shield:

- (1) John Zimmerman
- (2) Alan King (aged 41, he tells me). Alan's copy of *The Hobbit* is now fighting back in retaliation for being solved! Perfectly behaved until Alan cracked it, the program has since crashed about half of the time, usually when climbing into the Barrel (but see later, Alan), stings Alan to death in previously safe places, transfers him from dungeon to dungeon, and so on.
- (3) Brian Foote, who reckons his 97.5 percent is a record. Apart from the odd, rogue 215 percent, I think he may be right (unless you know better), and he included a data tape to prove it.
- (4) George Findlay
- (5) Christopher Kenworthy
- (6) Bret Sampson, who then wrote 83 after his name — whether this is an allusion to his age, or the year, I know not!
- (7) Russell Lewins, who had to work very hard!
- (8) Tony Aspinall

(9) Bilbo Baggins of Guemsey. So that's where he is now, he seems to get over the place! He has sent me a complete solution to the program, and all on one sheet of paper too — 85 feet long! Bilbo has done the whole thing in just 50 moves, and says that some (and rather like speeding through Paradise on a motorway!) eight of these may be omitted — surely a record?

(10) Justin Scharvona, who offers a way of overcoming the tendency for the program to crash when climbing into the barrel — *OWJAIIMTPFOONRTBOUBTALRER-RETL* and then type *OJBUMR-PROENLT*. If you haven't seen this code before, start at the second letter of each sentence, then read off every other letter. When you reach the end, return to the first letter, and repeat the process.

Justin reckons, incidentally, that a Polaroid camera would help in recording Hi-scores achieved in arcade games (see my comment of a couple of weeks ago) — but the software houses ought to provide the facility.

I agree, however, with his views on *Manic Miner* — certainly the best arcade game around for the Spectrum.

(11) Martin Jones, jointly with Andrew Sweetland, who, like one or two others, has noticed *Hobbitbug No 233*. If you enter "EN DO", the Black River evaporates, Gollum dies and the Sword breaks — not bad for two little words, eh?

(12) Steven Martin

(13) Alan McDonald, who has also solved *Golden Apple*, the new Artic adventure, which took him all of three days (must have been difficult — Adventure C took him a morning!). His friend, Chun Nok Fung, would like it known that he has finally managed to get through the Green Door — with a little help from Gandalf!

- (14) Ian Morse
- (15) Paul Catterfield
- (16) P Macy, who managed to drown Gandalf in the process!
- (17) John Parker
- (18) M Bannon

I only have room left now for grovel. I have had pointed out to me by several better adventurers than myself, that the coin in the lake, in *Artic's Planet of Death*, and the computer, are not red herrings. I'm glad about this, as it took me ages to get that coin! Try this (with our decoding procedure mentioned earlier): *EUG-SUEACRODINTPORBIRS IOBN* and ask the computer *HTEYLPPE* if you're stuck.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to: Tony Bridge, Adventure Corner, *Popular Computing Weekly*, 12-13 Little Newport Street, London WC2R 3LD.

LEFT TO RIGHT

Justin Fackrell, of Caswell Drive, Caswell, Swansea, writes:

Q Please can you help me? I have recently been writing some games for my BBC micro. I have learned **Scroll** the screen up and down for Asteroids type games but I cannot **Scroll** from left to right, or right to left. Is it possible?

A What you need to do is use VDU 23 to access the 6845 screen chip directly, using registers 12 and 13. Because the computer only has to change these two registers, you can have some very fast **Scrolling**, and you get the effect of screen wrap-around by setting the start of the screen memory higher than its normal starting position.

TOKENISED INPUTS

Hugh Geddis of Grange Farm Road, Maryport, writes:

Q A few weeks ago you mentioned tokenised inputs for the Vic20. I recently got a Vic20 for my birthday, and would like to know what tokenised inputs do.

A This is in your manual on page 133, appendix D, 'abbreviations for basic keywords'. It is a shorthand form of entering commands.

The Vic stores its Basic words at a series of addresses in the memory. Instead of printing the entire word, we can use the token or abbreviation. Terry Wallbridge, a reader who wrote to me a few weeks ago, supplies this example:

```
100 PRINT "TEST" : POKE 127,
PEEK (345) : IF I = 0 THEN
RESTORE : GOSUB 10 : PRINT
AS : POKE 1, PEEK (2335) AND
```

```
129 : GOSUB 30 : PRINT WS
NEXT I : NEXT L : LET O = 9
```

If you tried to enter this as part of a program it would be far too long (I have added a couple of extra spaces for clarity, but even without these it would be too long to be accepted on to the Vic screen display). However, if you try entering the following you will be left with a screen line of 83 characters, which is acceptable to the Vic. All the shifted characters are in italics:

```
100 ?-TEST: PO 127, PE (345), IF
= 0 THEN: GOSUB 10 : ? AS
PO1, PE (2335) AN 129 : GOS
30 ?WS: NEI, R: Q = 9
```

After I pointed out the difficulty of getting upgrades for the issue 1 Spectrum, Paul Rason of Delta Research phoned me to say that his company specialises in just this upgrade. It comes on a single board and costs £33 inclusive. Also included is a diagnostic tape to check the RAM.

Delta Research is at 13 Church Street, Basingstoke, Hants RG21 1QG.

■ If you want to telephone, the number is (0635) 45373.

COMPUTER ADVICE

A Simmons of Botley Road, Botley, Chesham, Bucks, writes:

Q I am the owner of a TI/99/4a, and am fortunate enough to be starting computer studies at school later this year. I am a keen programmer, but I would be grateful if you could give me some advice as to whether I should keep my computer and add peripherals (which are expensive), or whether it would be better to buy a different computer (no more than £200).

A I do not normally give direct advice about buying computers, because features of the various models are most important to you. However, there are some things you might wish to consider.

For the O-Level syllabus you really need a printer, with a TI/99/4a. It will cost about £130 to get the motherboard extension unit, and another £100 at least to get an RS232 interface to run it (assuming that your school or a friend has

one). For that much money it might be better to look at a 48K Spectrum or Oric, both of which have their own printer.

The other thing about the TI/99/4a is that its Basic is different from that used by the most common school computers. It could be useful to talk to your computer teacher and find out what machine(s) you will be using in class.

UP FOR SALE

Craig Shortland of James Street, Earl Shilton, Leicester, writes:

Q Is it in order for me to convert a program for use on another computer and then offer it for sale? Or would I need prior permission of the author?

Secondly, could you tell me the equivalent of **Lefts**, **Rights** and **Mids** on the Spectrum.

A I suggest you look at our 1-7 September issue. On the front page we ran a story about the injunction that Century Electronics gained against Superior Software, on the grounds of infringing copy-right.

The whole question of copy-right is still shrouded in mystery, with no one exactly sure just how the law affects computer programs. However, I think it would be polite to contact the author first.

As to your second question, the Spectrum uses the command **TO** for splitting strings.

ITALIAN TV

P Morrow of Darnorton Drive, Greenford, Middx, writes:

Q My company will be sending me abroad soon for three years. Can you tell me if my 48K Spectrum will work on the Italian television system? I still have my ZX81 (16K): would that work too?

Another question concerns the Microdrive. Will it be

possible to record on Microdrive a program that is already on cassette? (Mind you, I shall not bother to get a Microdrive until the first million faulty ones have been returned. I have had enough trouble with my Spectrum already!)

A Most of western Europe is 625 line, 8 MHz, FM UHF, as are we. (The exception being France.) Because of this it should be possible to use your Spectrum in Italy. Problems might occur if you tried to play sound through your television as well. There is a half MHz difference in both the vision bandwidth, and the sound vision spacing. This would make it difficult for both sound and vision to be tuned together. The same applies to your ZX81.

You can transfer a program from tape on to the Microdrive. It is a question of simply loading the program into the memory of the computer, and then simply Saving it into the Microdrive. Your scepticism about the Microdrive is shared by many, not surprising given the problems with the early Spectrums. Conversely the Microdrive is cheap, ingenious and unique and I am sure that demand will exceed supply for many months to come.

Dennis Hutchinson of Melbourne Close, Middlesbrough, has written to tell me of a simple way of replacing a lost header on Spectrum programs.

He used another program on tape that was at least the length of the one he wanted to add the header to. This was **Loaded** as normal, but as soon as the header was **Loaded**, he pulled the ear-plug out. Next, he put the program without a header into the tape recorder and wound to the start of the program, pushed the ear-plug back in and the computer was fooled into **Loading** the program.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem **Peek** it to Ian Beardsmore and every week he will **Poke** back as many answers as he can. The address is **Peek & Poke**, PCW, 12-13 Little Newport Street, London WC2R 3LD.

New from SUNSHINE Master your ZX Microdrive

programs, machine code and networking by Andrew Pennell

Master your ZX Microdrive contains the information you will ever need to use the ZX Microdrive the full. Clearly explained, with many examples, it is equally suitable for the relative newcomer to BASIC through to the experienced machine code programmer.

Andrew Pennell has also included a full database file handling program to let you put the ZX Microdrive to practical use with your Sinclair Spectrum.

Look out for the Sunshine range in W.H. Smith's, Boots, John Menzies, other leading retail chains and through our national network of book shops and specialist stores. Dealer Enquiries: 01-734 3454

NEW RELEASES

ELEPHANTS

Steeple Jack is an infuriating new arcade game for the Atari. Your seemingly simple task is to send Jack climbing higher and higher up a series of chimneys.

Occasionally, Jack is thwarted in his climb by a break in the ladder and he must jump to another nearby. The problem is that someone is dropping various strange objects on top of him — elephants for example.

Needless to say, Jack must avoid such hazards, while still trying to rise as high as possible up into the stratosphere.

Program *Steeple Jack*
Price £14.95
Micro Atari (16K/32K)
Supplier English Software
Box 43
Manchester

SECRET CODE

Quick as a flash comes *Computer War* in which you must destroy incoming missiles by cracking a secret code before world obliteration follows — remind you of anything? After the movie and the book comes the game based on *War Games*.

The plot of the game closely follows that of the film — you must first gain entry to the battle computer by cracking a secret code, then you must track the simulated enemy missiles and finally destroy them in a duel to the thermo nuclear death.

Being cartridge based, this

must be one of the few epic games to be announced recently that you won't be able to run on your Spectrum, despite Thorn's moves in that direction.

Program *Computer War*
Price Atari/Texas £28 (average)

CARTOON

And still they keep on coming. Hyperion Software is yet another new company selling Spectrum software.

In *Roadracer*, you are a coyote desperately trying to catch a road runner.

The program sticks quite closely to the sublime cartoons — in the first screen you try to drop an anvil on the bird as it moves past — if you miss, the anvil bounces on the ground and comes up to flatten you. Squashing the roadrunner gets you on to the next screen, where you stand on top of a cliff with the anvil waiting to swing down and so on.

It's a great idea (always was) and graphically the game is not bad but the whole thing is spoilt (except for very young children perhaps) by being almost entirely in Basic. This means that movements are very clumsy indeed — the coyote moves as though he were on wheels with his feet tied together.

More time and trouble over the animation, plus a few machine code splats, could have made the game a winner. Still, I suppose young children might, as with the cartoon, be entertained by the coyote's inevitable and violent demise.

MONOPOLY

Twelve games is a fairly sizable way to launch yourself on to the software market.

Temptation Software comes in a rather interesting cassette box with a silvery cover and a cut out section showing the actual game illustration.

Of the 12 titles, one of the most welcome will be *Micropoly* which allows you to play monopoly on your Vic or Dragon with the computer acting as board and banker.

In an unusual move, both versions are on one cassette. The Vic version requires 16K.

Program *Micropoly*
Price £5.95
Micro Vic20/Dragon 32
Supplier Temptation Software

Rye
East Sussex

SIMPLETON

Quest is an adventure game that seems to include just about every feature of every adventure game you've ever heard of. Taking the role of either wizard, cleric, rogue, fighter or simpleton (does anyone ever choose simpleton?), each with their own strengths and weaknesses, you must locate a special map.

On your way you will meet dozens of gruesome monsters whom you will have to fight for treasure, or simply to continue on your quest. The victor is decided by a complex comparison of combat points, weapons, defence and, of course, luck.

The press release on this game gives a number of helpful clues in playing the game. For example, when you start you should go... (we're not having that — the Elf Most High).

Program *Quest*

FILED

The latest addition to Kenema's range of serious packages for the Oric is *Oric Filestar*.

The program, which is roughly equivalent to *Vu-File* on the Spectrum, enables you to use your computer as a filing system. For example, if you have a list of names and addresses and all you know about someone is the name of their street, the computer should be able to find the file given only this information.

The program comes with a manual which illustrates how to use the chief feature of the program.

Program *Oric Filestar*
Price £12.00
Micro Oric 1 (48K)
Supplier Kenema Associates

GHOSTLY

Texas owners must be grateful for all the software they can get, since the machine is short of good programs from independent suppliers.

Stainless Software offers nothing but Texas Instruments, programs for both the Basic and enhanced machines. *Zombie Mambo* is a two program pack containing a creepy maze/chase game.

In the first section you must dig up three keys hidden in the graves. Should you pick an inhabited grave, its recently deceased occupant will come after you — you must avoid his touch.

Having found the keys, you will be able to enter the labyrinth in part 2. Here you find your way around the vaults looking for treasure and avoiding more monsters. Finally, you have to find your way out.

Program *Zombie Mambo*
Price £15.00

DATABASE

Despite it being (relatively) cheap, Commodore is still keen to promote the idea that the 64 is an effective business machine. The promotion of this view may be aided by a sophisticated package from Audiogenic called *Magpie*.

Magpie is a database that uses a series of overlapped menus to enable you to create records of up to 6,000 characters. You can program a series of operations for *Magpie* to extract any given piece of information and then perform complex mathematical calculations upon it.

The program, which is written in machine code, is also compatible with *Wordcraft 64*.

AT LAST, VALHALLA

After what seems like eons, *Valhalla* has arrived.

Roughly a year ago, we saw the first reviews of *The Hobbit* — the game that has stayed at the top of almost everybody's list of the best Spectrum games. Little wonder then that the first question everyone asks about *Valhalla* is: "Is it as good as *The Hobbit*?" The answer is... it all depends.

For those who don't yet know it, *Valhalla* is an animated graphics adventure game with over 100 different locations and 36 characters, all of whom have different personalities.

At first glance, a comparison with *The Hobbit* looks useful. As the program finishes *Loading*, after the excellent title screen, the computer draws an impressive castle in a picturesque setting — *Valhalla* — but you may not enter until you have completed six tasks.

However, a few moments later you realise that something new is happening, objects appear closely followed by figures who wander around and talk to one another.

Gradually, as you move around *Valhalla*, you meet the entire cast and begin to recognise the different personalities and start to understand which characters are likely to help you achieve the first of your quests.

There are no words or phrases to be guessed in *Valhalla*, the manual lists them all and the syntax editor won't let you enter anything which is not in its vocabulary. Neither does *Valhalla* have the kind of logical puzzles that were the bane and pleasure of *Hobbit* players everywhere.

The only way to start to master *Valhalla* is to live in its world, talk to all the characters, ask them questions, ask them for help just as they ask each other to do things and ask each other for help. Gradually you can earn the respect of those influential characters

like Odin and Saga who can help you find the more elusive objects.

I spent a day with *Valhalla* and didn't even master the first quest, this is not just because I am an incompetent adventurer, it's simply that *Valhalla* is so... watchable. Just because you are doing nothing this is no reason for the other characters to interrupt their business. Even if you start alone at a location, you will soon be joined by various goodies and baddies who will fight, eat, pick up objects, and talk.

The problem with simply watching *Valhalla* is that you may forget to let your character eat, and unless you eat you die. Dying definitely loses you credibility amongst your friends, but it is not the end of the game. Death in *Valhalla* simply transports you to a god-forsaken wasteland in Hell where you start again, minus many of the useful objects you may have acquired.

Valhalla is really a different ball-game from *The Hobbit*. *Hobbit* could always be described as an adventure in the classic mainframe form, except that it understood sophisticated sentences and had impressive graphics, the rules and puzzles were similar.

Valhalla isn't like anything else. Rather, I suspect, it's the first attempt at something different — liveable movies. Play it for yourself, I don't think you'll regret the £15.

Ziggurat

Intelligence test?

Lately I have been considering what it is to be "intelligent", and what constitutes "intelligent" behaviour.

The idea of trying to gauge what it is to be intelligent, and how we could establish in what way an intelligent being would behave, is symptomatic of our insecurity when faced with the thought of an intelligent machine.

A typical test of intelligence was propounded by Alan Turing. Turing's test of intelligent behaviour has now been used as the reason behind yet another book containing a collection of computer games. I cannot remember too much about the book, but I do remember that the games were given as an example of potential intelligence.

At the time, I thought that the book said more about the potential intelligence of the authors, and their eye for the main chance, than about the possible intelligence of their games. This book's authors thought that Turing and his test added some kudos to their efforts. So, what is his test?

At the simplest level, you sit at a terminal. The person at the other end is either male or female — purely by questioning, you have to decide which he or she is. Turing's test was: could you tell whether the person at the other end was male, female, or realise that it was a computer?

A truly intelligent computer would be able to bluff its way, and convince you that it was either male or female.

An early attempt to try out something like this was Joseph Weisenbaum's *Eliza* program, also called the *Doctor* program. The nature of this program is well known — the computer is programmed to ask empty questions (in questions which do not require any personal informa-

tion), and not to give any answers.

An empty question might be "What is your problem?", to which an answer might be "Computers". The program searches through the reply, recognises the keyword *computers*, and so answers "Do computers worry you?". Some people can get very carried away talking to *Eliza*.

Weisenbaum tried out *Eliza* on his secretary. She knew that it was only a program, but after a while she turned to Weisenbaum and asked him to leave, because the conversation was private. This story is often used to show how even simple programs have some intelligence.

But, this argument fails totally. If the feeling of personal empathy the secretary felt with the program is taken to indicate intelligence on the part of the program, a child's doll is intelligent — the same empathy exists.

Part of the human condition, and a true measure of the creative intelligence of humanity, is the ability to suspend belief and to become part of the action. If intelligence consists of the ability of the non-human agent to convince the human of its reality, then the film *Love Story* is intelligent, given the reaction of cinema goers.

Mechanical devices, and computers far more than any other device, capture the imagination of the human. The human, by use of his imagination, can make the machine a real part of his world.

The reaction of the secretary is no different to the mindless subservience of many (young and old) to video and computer games. The desire to make the game live, or pour out one's heart to *Eliza*, is the same mysticism which produced lotism in primitive societies.

In some primitive societies, each grouping was known by the name of a living object — animal or vegetable — and in some cases the identification with that object made it into a religious item. Are we beginning to treat computers in a similar way?

The bleary-eyed child who worships his Spectrum does not prove the potential intelligence, or otherwise, of computers. He proves that humanity is blessed (or damned) with a powerful imagination.

The Turing test does not show intelligence, it shows the ability of humans to transcend reality — just as the bleary-eyed child is actually fighting his way through the caverns and lairs. ■

Boris Allan

Puzzle

A dicey proposition

Puzzle No. 77

Arthur, the confidence trickster was up before the magistrates again!

"But yer 'onour," pleaded Harry, "I was only inviting punters to win a few bob in an 'onest wager."

"And how was the wager arranged?" queried the magistrate.

"Well, me lud, let's say you puts down a quid, an' then I puts down a quid. Then you takes these 'ere four dice — and they are 'onest dice, on me 'onour, yer 'onour. As I was sayin', you throws these four dice, an' we multiply together the numbers thrown. Then, we adds together the numbers in the answer — that's if there is more than one number — and if the answer 'ad more than one number still we keeps on addin' until only a single figure remains. If this is even then you win the two quid, if it's odd then you lose."

"You see, your worship, it's an evens bet. Dead 'onast!"

Well, is it? How would you rate the odds?

Solution to Puzzle No. 72

We know that the price of chips is less than 75p so the program assigns values from 1 to 75 to variable C, and tests the other prices from the menu. Then when a value is found that agrees with all the prices, we have the correct answer.

10 FOR C = 1 TO 75

20 LET S = 100 - C

30 LET E = 110 - S

40 LET B = 100 - E

50 LET T = 95 - B

60 IF T + C = 77 THEN PRINT "THE PRICE OF CHIPS IS":C

70 NEXT C

Once we have this value we can find out the prices of all the other items.

The answers are: chips 35p, sausage 65p, eggs 45p, bacon 55p, tomatoes 40p and chicken £1.30.

Winner of Puzzle No. 72

The winner is: Mike Warren, Capell Avenue, Chorleywood, Herts, who receives £10.
